The number of wireless network users has remarkably grown by recent advances in wireless communication technologies such as Wi-Fi and 5G. This has led to a lack of spectrum resources, which has therefore become an important issue. To overcome this problem, spectrum sharing technology, whereby a Wi-Fi system temporarily uses a spectrum band of a WiMAX system, is receiving much attention. We propose a dynamic spectrum sharing method for ultimate utilization of wireless communication resources.

In addition, new services based on M2M (Machine-to-Machine) and/or IoT (Internet of Things) communications are also attractive. In such a network, tremendous number of terminals including sensors, actuators, etc. are connected, so that traditional networking technologies does NOT work well. We propose a new network platform to support M2M/IoT services in a unified manner.

Specifically, we research on the following topics.

- Efficient spectrum sharing
- Dynamic cell area optimization
- Routing, buffer control, and channel assignment method in heterogeneous wireless multi-hop networks

Keywords: wireless network, spectrum sharing
